According to the Task I Have created all the fields and checked for validation and all.

What I have done: -
 I created a small website kind of structure where user can login n signup for the same.
There is a signup page (register.php) where the user can sign up for the content.
After signup a user must login to see the data and able to download CSV FILE of the details he entered during registration.

(as per the task I understood this much work only that I have to do if there is something missing then I am sorry for that because I have to go urgent somewhere today)

Pages :-

1) Index.php(homepage for signup and login plus contact form also)
2) Register.php(for registration of user)
3) Lg1.php(login page for the user)
4) Details.php(fetching the details of the particular user who has logged in)
5) Receiver.php(the page which display the content of the user and a download button for CSV)
6) Connection.php(for the connection to the database)
7) Abmi.sql(for sample data)
8) Logout.php (to let user logout and to destroy the session created)
